

what we did — one boundary

circulant — depends only on separation

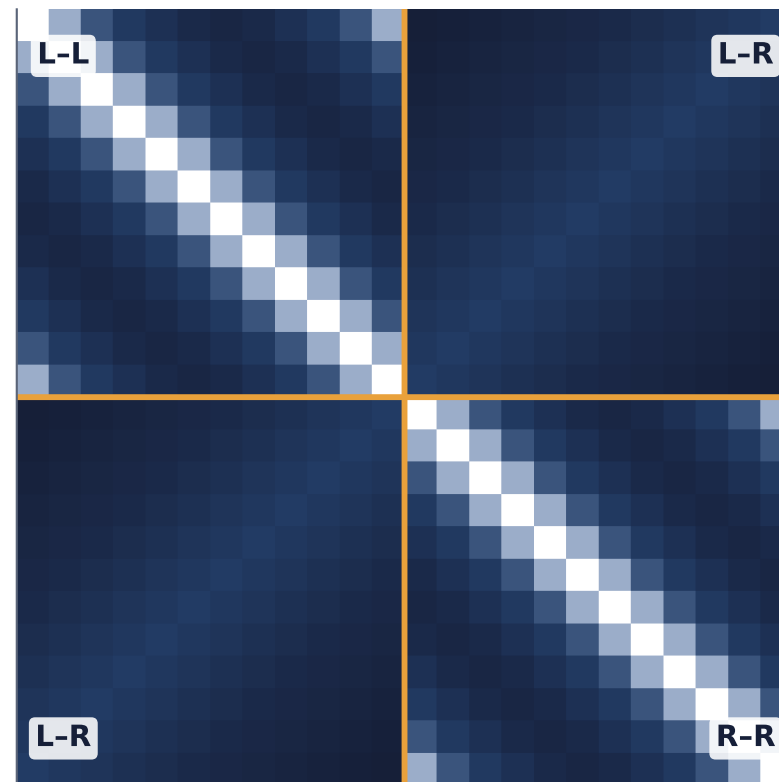

filtration forced through $C_{24}(1..k)$

theorem applies $\Rightarrow$ one H_1 bar, two scalars

H_1 cannot carry information

(real matrix, $N = 18$, $\beta = 5$)

what should be done — two boundaries

block structure — L-L, R-R and L-R

not circulant: no forced nesting

theorem does NOT apply

H_1 could carry information

(proposed — not yet run; matrix is illustrative)
