

the criterion

barcodes agree $\Leftrightarrow \hat{G}_{\text{SYK}}(1) = \hat{G}_{\text{ER}}(1)$ and $\hat{G}_{\text{SYK}}(8) = \hat{G}_{\text{ER}}(8)$

what the data says

the C that matches $\hat{G}(1)$ is not the C that matches $\hat{G}(8)$

N=12: 1.47× N=14: 7.81× N=16: 3.14× N=18: 1.86×
ratio $C_{\text{fit}}(\hat{G}1) / C_{\text{fit}}(\hat{G}8)$

no single C satisfies both

so the two barcodes cannot be made isomorphic
by any choice of the dictionary parameter

*and this is a statement about SHAPE:
it does not depend on the value of C at all*

(at $\beta = 40$, the only cells where a fit exists at all)
