

what we did — one boundary

circulant — depends only on separation

filtration forced through  $C_{24}(1..k)$

theorem applies  $\Rightarrow$  one  $H_1$  bar, two scalars

**$H_1$  cannot carry information**

what should be done — two boundaries

block structure — L-L, R-R, and L-R

not circulant: no forced nesting

theorem does NOT apply

**$H_1$  could carry information**
